CORSO DI LAUREA IN INFORMATICA

ES Lab Exercise on LLMs

PROFF. Giuseppe Scanniello, Simone Romano, and Pietro Cassieri

October 13rd

GROUP 0, GROUP 1, and GROUP 2

- Students in Group 0 **did not take part in the mandatory preparatory classes, especially that of October 8th**
- Students **in Group 0 can participate in the lab exercise, but** (as stated more than once during the classes) **will not receive the bonus on their final grade**
- Students in Group 1 and Group2 will take the bonus because they participated in all the mandatory classes
  - There are only a few (justified) exceptions

We will call you by group

Participants

Group 0

Group 1

Group 2

13 Oct
Task #1

15 Oct
Task #2

GROUP 0

- Download this project from google drive:

https://shorturl.at/FlrNa

- Import the project into Pycharm
- You can complete the project using LLMs or Search Engines. Do your best to complete the task!

- **No artifacts need to be returned to the lecturers!**

Students in Group 1 and Group 2

- **Pay attention to the instructions in the following slides**
- **If there is something unclear, ask for clarification!**
- **If you did not follow the instructions carefully, there is a risk of not getting the final bonus**

Task Execution
WITH LARGE LANGUAGE MODEL

- You MUST use **only Copilot 365 (as shown in the first class, October 1st)**:

https://m365.cloud.microsoft/login

(Access with your UNISA account)

- **You CANNOT USE other resources, such as Google, DuckDuckGo, documentation, etc.**

Task execution
WITHOUT ARTIFICIAL INTELLIGENCE

- You MUST use **only DuckDuckGo** as your search engine, and its usage MUST NOT be augmented with artificial intelligence features:

  https://duckduckgo.com

  To use DuckDuckGo **without AI features**, simply **DO NOT click** on buttons like 'Search Assist' or 'Duck.ai', which are AI-powered.
- You **CANNOT** use any search engine other than DuckDuckGo. Using Google or any other search engine is prohibited.
- You **CANNOT** use any AI tools, chatbots, large language models, or similar technologies.

Task Materials – GROUP 1 AND GROUP 2

- Log in to GitHub and fork this project:

https://github.com/sromano-research/NetworkX_Task

- Import Your forked project into Pycharm
- The project contains two main files:
  - **readme.md**: describes the features to implement. Each feature is represented by a sub-task and a Python function to implement. The total number of functions to implement (and sub-tasks) is five. Read readme.md before implementing functions!
  - **task.py**: contains the declarations of the five functions to implement; at the beginning of the task, all functions are empty stubs. Write the code for each function during each sub-task. It also contains a main() function that can be executed to verify your implementations

Task Execution Rules - GROUP 1 AND GROUP 2

- You **MUST** implement the sub-task functions following the order presented in readme.md; address one sub-task at a time, starting from the first, without reading ahead
- To advance to the next sub-task, you **MUST** commit and push your project. This marks the completion of the current sub-task. Once a new sub-task has begun, you **CANNOT** go back to modify functions from previous sub-tasks.
- You **CANNOT** change the declarations or signatures of the functions provided in task.py, nor rename them
- At the end of the task, you **MUST** ensure that the entire project has been committed and pushed to GitHub
- Communicating with other people, inside or outside the classroom, is **STRICTLY PROHIBITED**

Post-Task Activities – GROUP 1 AND 2

After completing the task, you must complete the following activities in the order indicated:

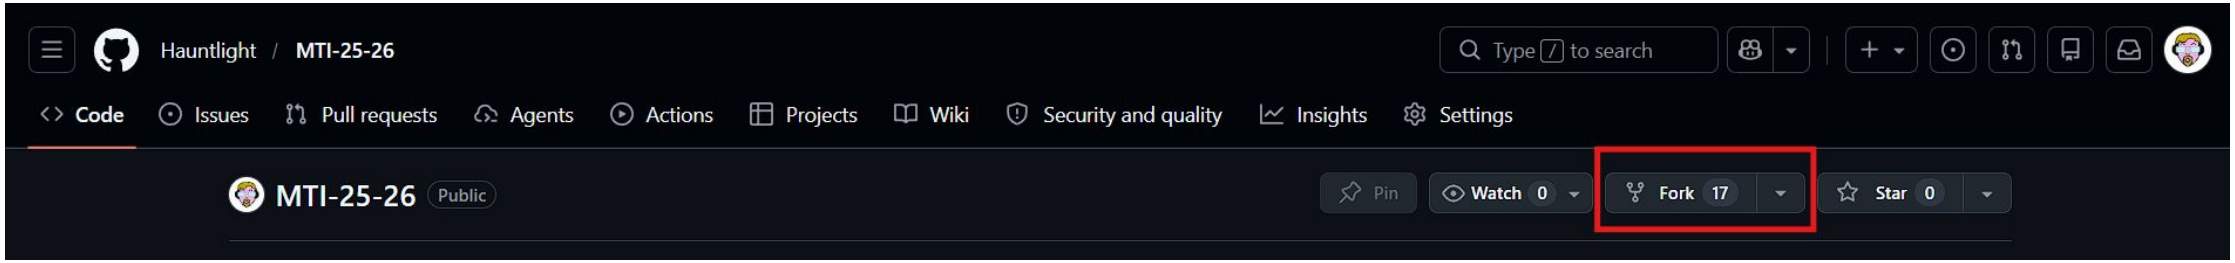

1. Open the post-questionnaire available at: https://forms.gle/jshb1iGrNyd43dARA and complete the NASA-TLX questionnaire; once finished, click the blue 'Copy Results' button to copy your NASA-TLX scores, then paste them into the designated field of the post-questionnaire to save automatically as draft
2. Once NASA-TLX results are pasted into the post-questionnaire and saved as draft, close your laptop screen without turning it off.
3. Complete the paper knowledge assessment questionnaire for NetworkX. Each question is associated with one of the sub-tasks and has one correct answer. You **MUST** answer only questions for sub-tasks you attempted. For example, if you reached sub-task 4, answer questions 1, 2, 3, and 4, and **DO NOT** answer questions for sub-task 5.
4. Once the paper questionnaire is completed, reopen your computer and submit the post-questionnaire

Backup Slide

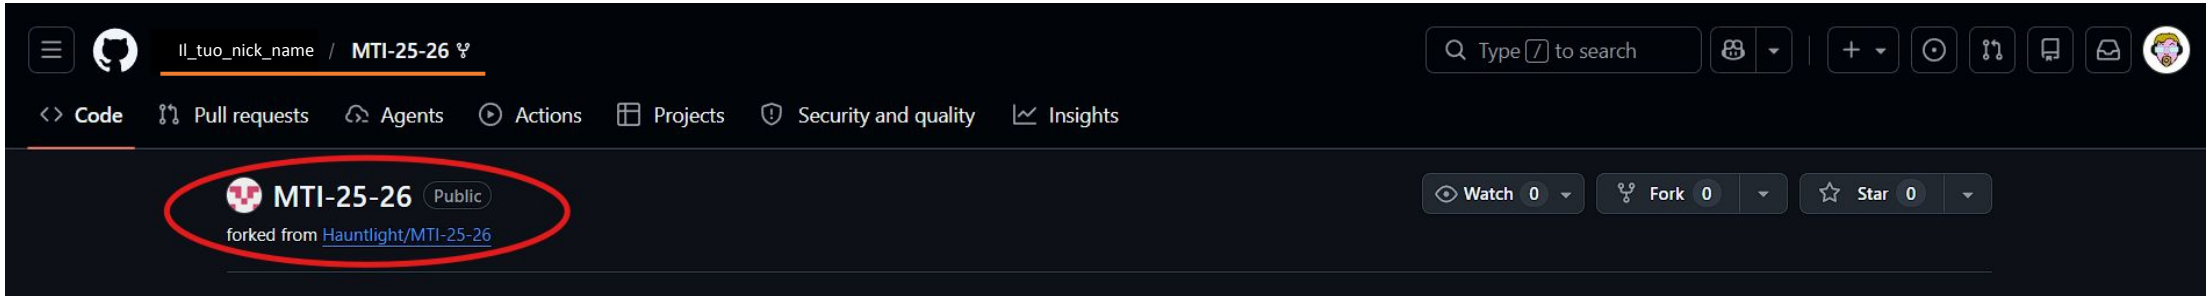

in case they are needed

How do I fork

- Visit the repository
- Click the 'Fork' button
- Follow the on-screen instructions

Make sure you are on your own repository after forking!

How do I commit and push?
